

New! DCA UDF and Video Verifier

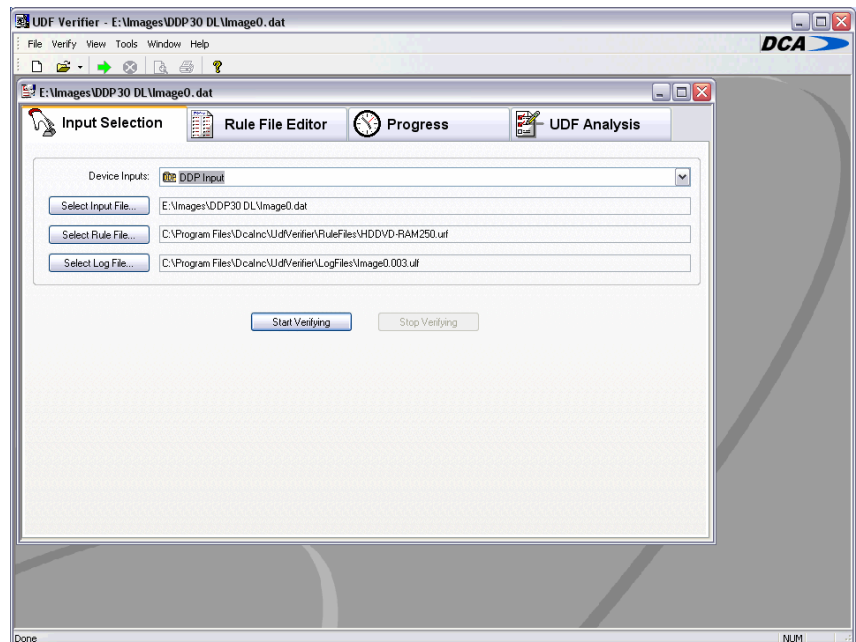

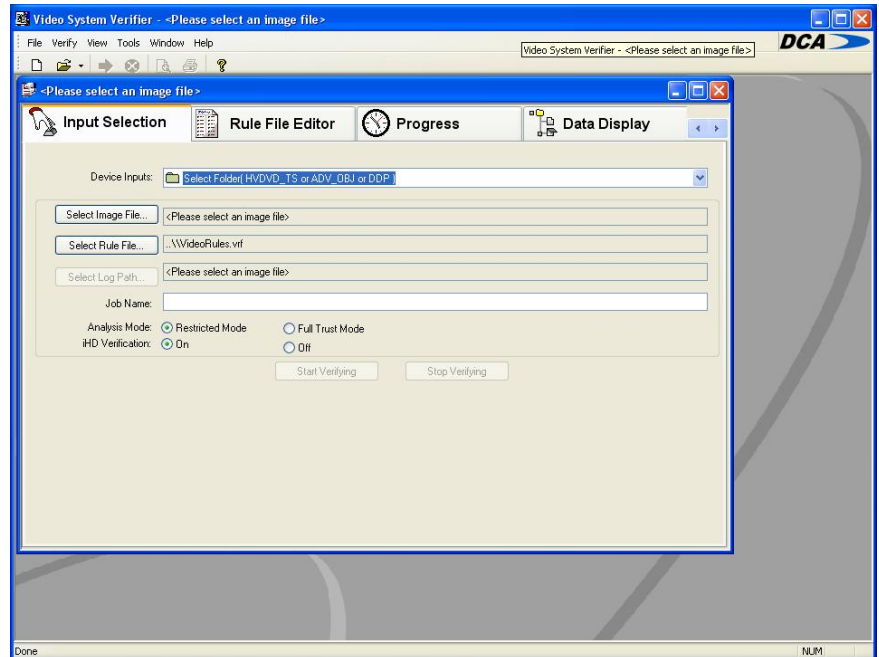

DCA's UDF and Video Verifier applications are simple, yet powerful analysis and validation tools for HD DVD. The UDF Verifier and Video Verifier are both approved by the DVD Forum for HD DVD.

The **DCA Video Verifier** validates the HD DVD video file system. Video Verifier supports the HD DVD v1.0 specification with October 2005 and February 2006 Supplemental Information. Both standard and advanced content are verified. As a standalone verifier, the product is optimized to make a single pass through the video and perform verification in at least real-time speeds.*

The application supports raw files (HVDVD_TS folders), UDF images, and HD DVD discs (including AACs protected media) as source media. For HD DVD discs, Video Verifier supports HD DVD Category 1, 2, and 3 discs (for standard and advanced content), as well as FullTrust and Restricted Mode.

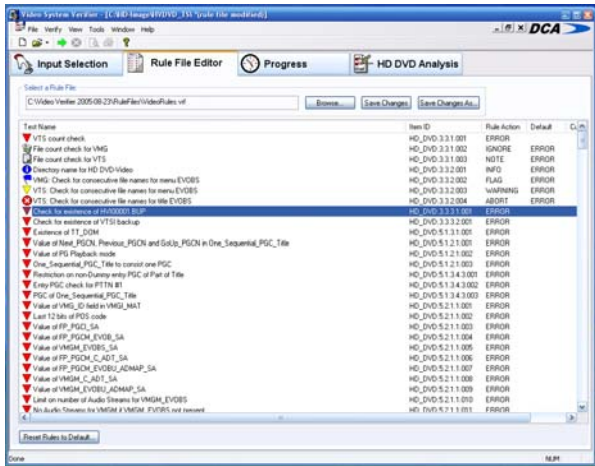

The Video Verifier includes a Data Display tab during runtime to show a tree view of all video system files and parameters, including standard and advanced VTS parameters.

The **DCA UDF Verifier** ensures that a HD DVD-ROM, HD DVD-RAM, or 3X-SPEED DVD-ROM disc complies with the File System specified for these media types. Users may select Image, Optical Drive, or DDP input as source media. Rule Files are available for HD DVD-ROM, HD DVD-RAM, and 3X DVD-ROM.

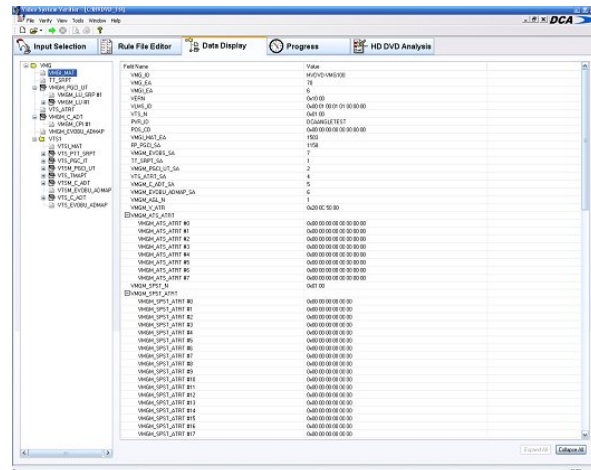

*Real-time speeds dependent on local processor speed, local memory availability, and network bandwidth. Real-time speed achieved in a test environment with a local file on an AMD Opteron system running at 2.4GHz and 1GB of memory.

Both applications have an easy to use, intuitive interface requiring minimal user training. The applications use rule file sets which allow users to configure which rules will be used for a particular test run and the error severity level, whether abort, error, warning, information, or flag.

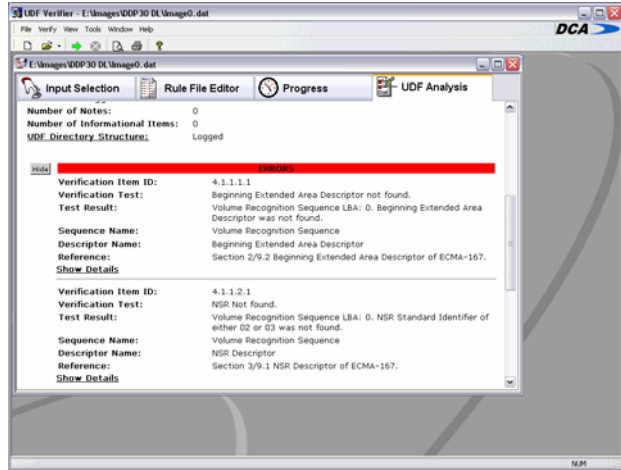

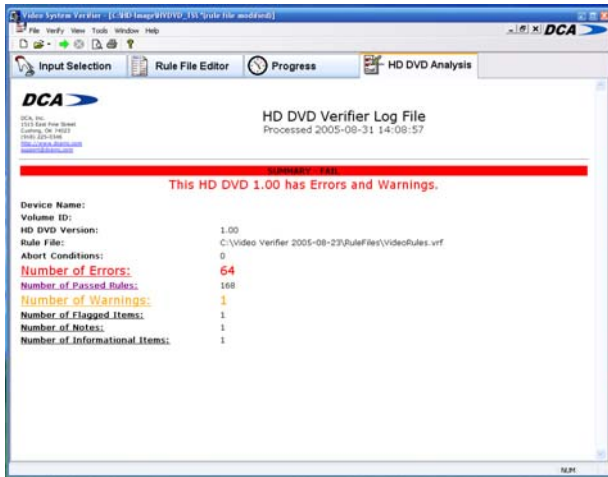

Rule File Editor tab

Data Display tab (Video Verifier)

Both applications display errors and location in the File or Video system, allowing the user to quickly locate and fix errors. Additionally, the exact rule definition from the specification is shown for verification.
